21.6 Applications

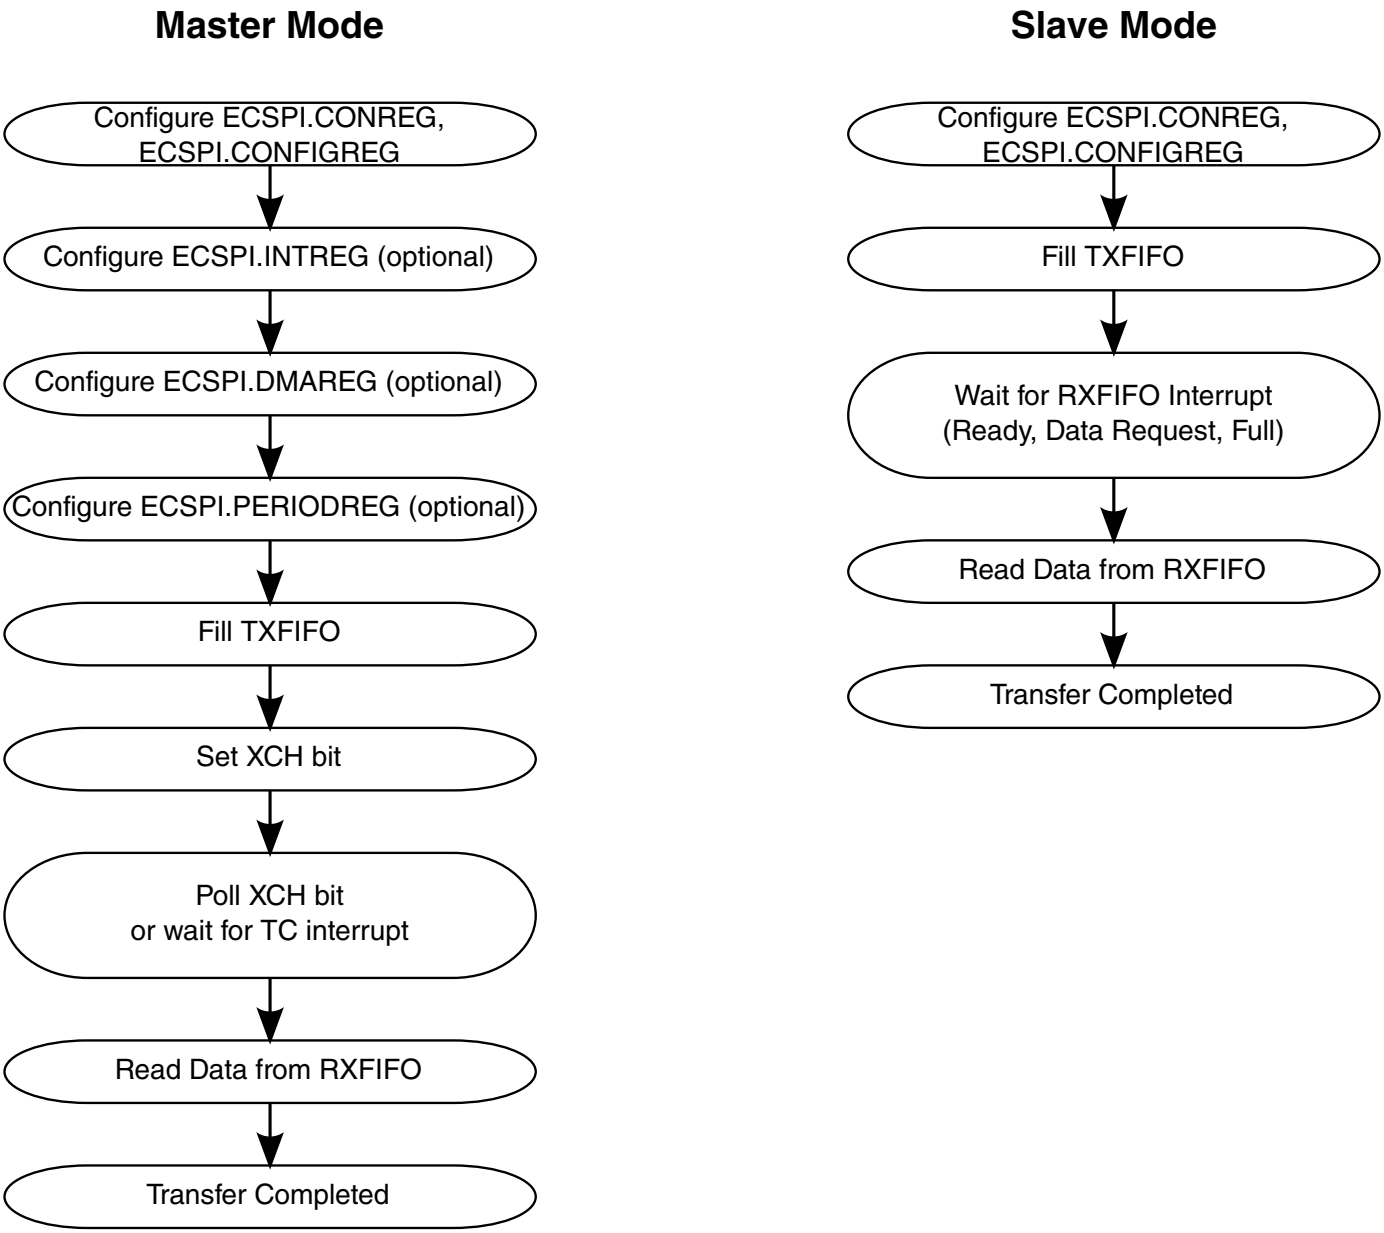

Figure 21-14. Flowchart of the ECSPI Operation

21.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
200_8000	Receive Data Register (ECSPI1_RXDATA)	32	R	0000_0000h	21.7.1/990
200_8004	Transmit Data Register (ECSPI1_TXDATA)	32	W	0000_0000h	21.7.2/991
200_8008	Control Register (ECSPI1_CONREG)	32	R/W	0000_0000h	21.7.3/991
200_800C	Config Register (ECSPI1_CONFIGREG)	32	R/W	0000_0000h	21.7.4/994
200_8010	Interrupt Control Register (ECSPI1_INTREG)	32	R/W	0000_0000h	21.7.5/996
200_8014	DMA Control Register (ECSPI1_DMAREG)	32	R/W	0000_0000h	21.7.6/997
200_8018	Status Register (ECSPI1_STATREG)	32	R/W	0000_0003h	21.7.7/999
200_801C	Sample Period Control Register (ECSPI1_PERIODREG)	32	R/W	0000_0000h	21.7.8/1000
200_8020	Test Control Register (ECSPI1_TESTREG)	32	R/W	0000_0000h	21.7.9/1002
200_8040	Message Data Register (ECSPI1_MSGDATA)	32	W	0000_0000h	21.7.10/ 1003
200_C000	Receive Data Register (ECSPI2_RXDATA)	32	R	0000_0000h	21.7.1/990
200_C004	Transmit Data Register (ECSPI2_TXDATA)	32	W	0000_0000h	21.7.2/991
200_C008	Control Register (ECSPI2_CONREG)	32	R/W	0000_0000h	21.7.3/991
200_C00C	Config Register (ECSPI2_CONFIGREG)	32	R/W	0000_0000h	21.7.4/994
200_C010	Interrupt Control Register (ECSPI2_INTREG)	32	R/W	0000_0000h	21.7.5/996
200_C014	DMA Control Register (ECSPI2_DMAREG)	32	R/W	0000_0000h	21.7.6/997
200_C018	Status Register (ECSPI2_STATREG)	32	R/W	0000_0003h	21.7.7/999
200_C01C	Sample Period Control Register (ECSPI2_PERIODREG)	32	R/W	0000_0000h	21.7.8/1000
200_C020	Test Control Register (ECSPI2_TESTREG)	32	R/W	0000_0000h	21.7.9/1002
200_C040	Message Data Register (ECSPI2_MSGDATA)	32	W	0000_0000h	21.7.10/ 1003
201_0000	Receive Data Register (ECSPI3_RXDATA)	32	R	0000_0000h	21.7.1/990
201_0004	Transmit Data Register (ECSPI3_TXDATA)	32	W	0000_0000h	21.7.2/991
201_0008	Control Register (ECSPI3_CONREG)	32	R/W	0000_0000h	21.7.3/991
201_000C	Config Register (ECSPI3_CONFIGREG)	32	R/W	0000_0000h	21.7.4/994
201_0010	Interrupt Control Register (ECSPI3_INTREG)	32	R/W	0000_0000h	21.7.5/996
201_0014	DMA Control Register (ECSPI3_DMAREG)	32	R/W	0000_0000h	21.7.6/997
201_0018	Status Register (ECSPI3_STATREG)	32	R/W	0000_0003h	21.7.7/999
201_001C	Sample Period Control Register (ECSPI3_PERIODREG)	32	R/W	0000_0000h	21.7.8/1000
201_0020	Test Control Register (ECSPI3_TESTREG)	32	R/W	0000_0000h	21.7.9/1002
201_0040	Message Data Register (ECSPI3_MSGDATA)	32	W	0000_0000h	21.7.10/ 1003
201_4000	Receive Data Register (ECSPI4_RXDATA)	32	R	0000_0000h	21.7.1/990
201_4004	Transmit Data Register (ECSPI4_TXDATA)	32	W	0000_0000h	21.7.2/991
201_4008	Control Register (ECSPI4_CONREG)	32	R/W	0000_0000h	21.7.3/991
201_400C	Config Register (ECSPI4_CONFIGREG)	32	R/W	0000_0000h	21.7.4/994

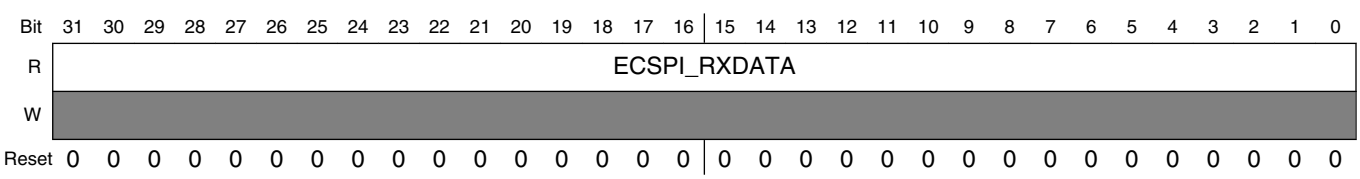
201_8040	Message Data Register (ECSPI5_MSGDATA)	32	W	0000_0000h	21.7.10/ 1003

21.7.1 Receive Data Register (ECSPIx_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset



ECSPIx_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

21.7.2 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BIT_COUNT field of the corresponding SPI Control register. If this field contains more bits than the number specified by BIT_COUNT, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

21.7.3 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	BURST_LENGTH												CHANNEL_ SELECT		DRCTL	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	PRE_DIVIDER				POST_DIVIDER				CHANNEL_MODE				SMC	XCH	HT	EN
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONREG field descriptions

Field	Description
31–20 BURST_ LENGTH	Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2^12 bits can be transferred in a single SPI burst. In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant (n = BURST LENGTH + 1) will be shifted out. The remaining bits will be ignored. In slave mode, only when SS_CTL is cleared, this field will take effect in the transfer. Number of Valid Bits in a SPI burst. 0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and 2^7 -1 words. 0xFFF A SPI burst contains 2^7 words.
19–18 CHANNEL_ SELECT	SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SSn) outputs. Only the selected Chip Select (SSn) signal can be active at a given time; the remaining three signals will be negated. 00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.
17–16 DRCTL	SPI Data Ready Control. This field selects the utilization of the $\overline{\text{SPI\_RDY}}$ signal in master mode. ECSPI checks this field before it starts an SPI burst. 00 The $\overline{\text{SPI\_RDY}}$ signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.
15–12 PRE_DIVIDER	SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock. 0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.
11–8 POST_DIVIDER	SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: 2^{n} . 0000 Divide by 1.

Table continues on the next page...

ECSPIx_CONREG field descriptions (continued)

Field	Description
	0001 Divide by 2. 0010 Divide by 4. ... 1110 Divide by 2^{14}. 1111 Divide by 2^{15}.
7–4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPI_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

21.7.4 Config Register (ECSPIx_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved			HT_LENGTH					SCLK_CTL				DATA_CTL				SS_POL				SS_CTL				SCLK_POL				SCLK_PHA			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

ECSPIx_CONFIGREG field descriptions (continued)

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set. SS CTL[3] is for SPI channel 3. SS CTL[2] is for SPI channel 2. SS CTL[1] is for SPI channel 1. SS CTL[0] is for SPI channel 0. In slave mode, this bit controls when the SPI burst is completed. An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data. 0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty. 0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid. 1 In slave mode - an SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.
7–4 SCLK_POL	SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 21-10 for more information. SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0. 0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).
SCLK_PHA	SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 21-10 for more information. SCLK PHA[3] is for SPI channel 3. SCLK PHA[2] is for SPI channel 2. SCLK PHA[1] is for SPI channel 1. SCLK PHA[0] is for SPI channel 0. 0 Phase 0 operation. 1 Phase 1 operation.

21.7.5 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

ECSPIx_INTREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

ECSPIx_INTREG field descriptions (continued)

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

21.7.6 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	RXTDEN	Reserved	RX_DMA_LENGTH						RXDEN	Reserved	RX_THRESHOLD					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	Reserved								TEDEN	Reserved	TX_THRESHOLD					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECSPIx_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request is generated even if it is less than or equal to RX_THRESHOLD. 0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_ LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request. 0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_ THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request. 0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_ THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is greater than TX_THRESHOLD.

21.7.7 Status Register (ECSPIx_STATREG)

The ECSPI Status Register (ECSPI_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

ECSPIx_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it. 0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it. 0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full. 0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request. 0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO. 0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

Table continues on the next page...

ECSPIx_STATREG field descriptions (continued)

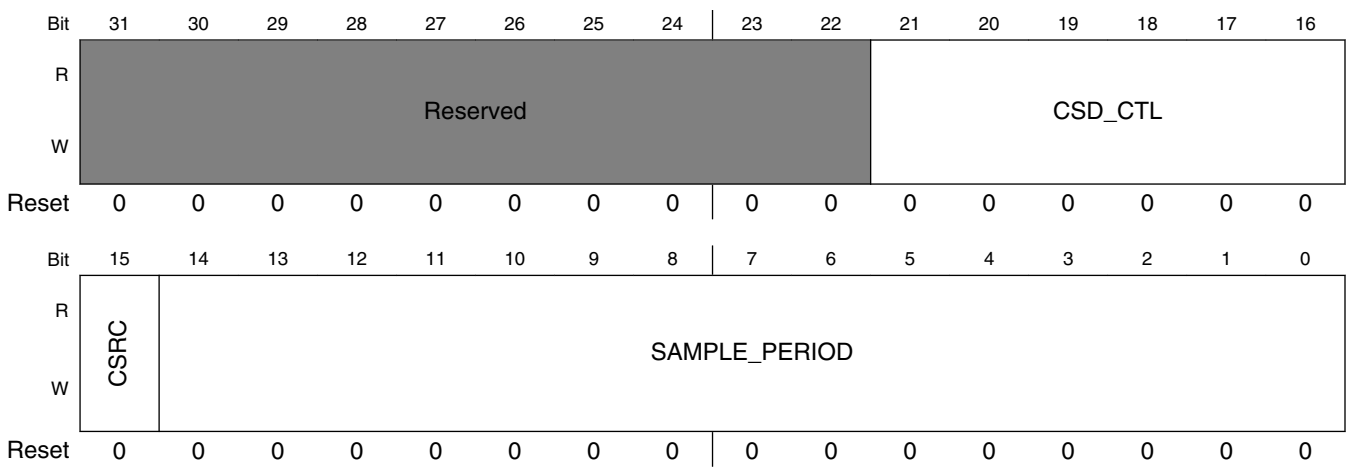
Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of empty slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of empty slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

21.7.8 Sample Period Control Register (ECSPIx_PERIODREG)

The Sample Period Control Register (ECSPI_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPI_CONREG[CHANNEL MODE] = 1).ECSPI_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset



ECSPIx_PERIODREG field descriptions

Field	Description
31–22 -	This field is reserved. Reserved

Table continues on the next page...

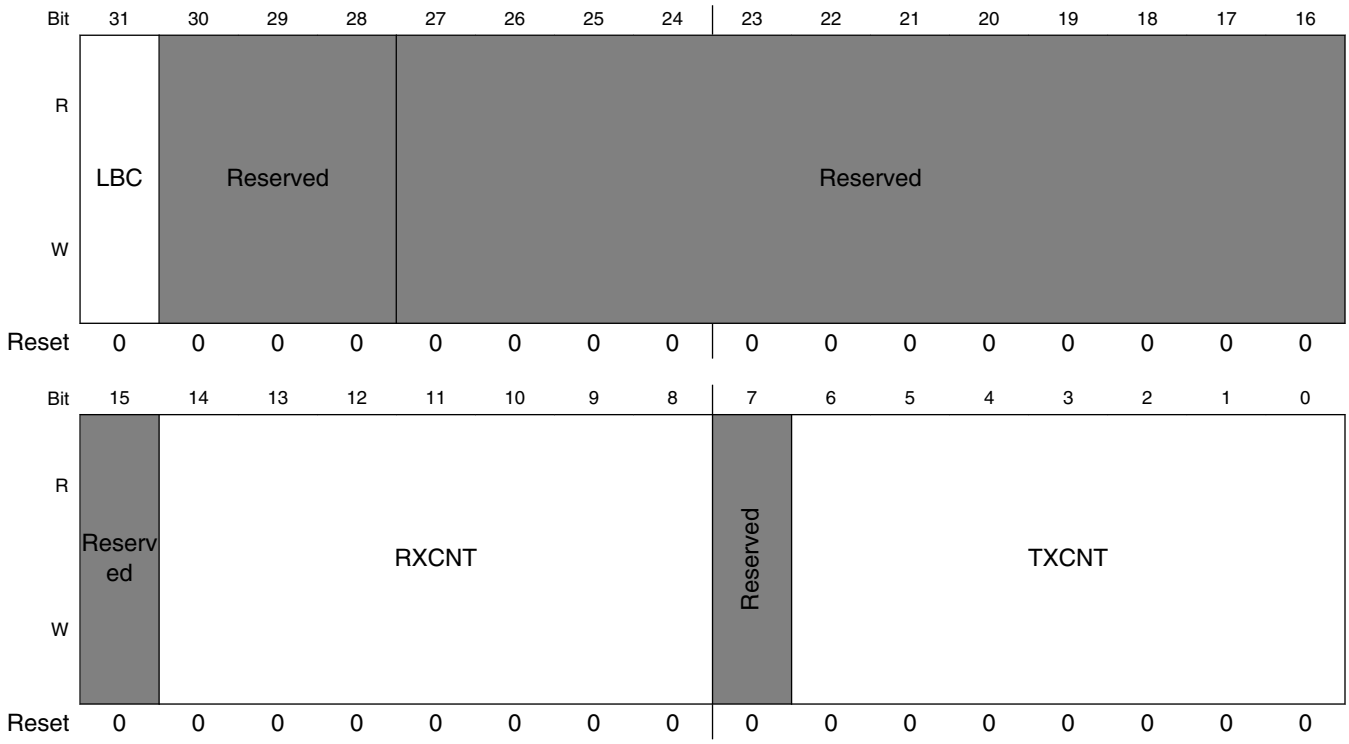
ECSPIx_PERIODREG field descriptions (continued)

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPI_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted ... ... 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

21.7.9 Test Control Register (ECSPIx_TESTREG)

The Test Control Register (ECSPI_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset



ECSPIx_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored. 0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

Table continues on the next page...

ECSPIx_TESTREG field descriptions (continued)

Field	Description
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

21.7.10 Message Data Register (ECSPIx_MSGDATA)

The Message Data Register (ECSPI_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_MSGDATA field descriptions

Field	Description
ECSPI_ MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.
