- **SPDIFTxLeft, SPDIFTxRight details**

With SPDIF Tx FIFOs three exceptions are associated.

- empty
- under/overflow
- resync

When the empty condition is set for processor data output registers, the processor should write data to the FIFO, before underrun occurs. When empty is set and, for instance, 6 samples need to be written, it is acceptable for the software to write first 6 samples from the LEFT address, followed by 6 samples from the RIGHT address, or 1 sample LEFT, followed by 1 sample RIGHT repeated 6 times. Left should be written before right. The implementation of all data out FIFOs is a double FIFO, one for left and one for right. Empty is set when both FIFOs are empty. Underrun, overflow are set when one of the FIFOs do underrun or do overflow. Resync is set when the hardware resynchronizes left and right FIFOs.

On receiving underrun, overflow interrupt, synchronization between Left and Right words in the FIFOs may be lost. Synchronization will not be lost when the underrun or overflow comes from the IEC60958 side of the FIFO. If the processor reads or writes more data from, for example, left than from right, synchronization will be lost. If automatic resynchronization is enabled, and if the software obeys the rules to let this work, resynchronization will be automatic.

#### 59.4.2.2 Channel Status Transmission

A total of 48 Consumer channel status bits are transmitted from two registers. Channel Status Bits are ordered first bit left.

CS-channel MSB bit "0" is located in bit position 23 in the memory-mapped register SPDIFTxCCChannelCons\_h. CS-channel bit "23" is considered bit 0 in the register. C-channel bits 24-47 are seen as MSB-LSB bits of register SPDIFTxCCChannelCons\_l.

#### 59.4.2.3 Validity Flag Transmission

The validity bit setting is performed via bit 5 of the SPDIF\_SCR register.

## SPDIF\_STCSCH field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.

Table continues on the next page...

**SPDIF\_STCSCH field descriptions (continued)**

Field	Description
TxCChannelCons_h	SPDIF transmit Cons. C channel data, contains first 24 bits without interpretation. When read, it returns the latest data written by the processor

**59.5.16 SPDIFTxChannelCons\_I Register (SPDIF\_STCSCL)**

SPDIFTxChannelCons\_I register is a channel status transmission register.

Address: 200\_4000h base + 38h offset = 200\_4038h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
TxCChannelCons_I	SPDIF transmit Cons. C channel data, contains next 24 bits without interpretation. When read, it returns the latest data written by the processor

**59.5.17 FreqMeas Register (SPDIF\_SRFM)**

Address: 200\_4000h base + 44h offset = 200\_4044h

FreqMeas	Frequency measurement data

## 59.5.18 SPDIFTxClk Register (SPDIF\_STC)

The SPDIFTxClk Control register includes the means to select the transmit clock and frequency division.

Address: 200\_4000h base + 50h offset = 200\_4050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### SPDIF\_STC field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–11 SYSCLK_DF	system clock divider factor, 2~512. 0 no clock signal 1 divider factor is 2 ... 511 divider factor is 512
10–8 TxClk_Source	000 REF_CLK_32K input (XTALOSC 32kHz clock) 001 tx_clk input (from SPDIF0_CLK_ROOT. See CCM.) 010 ASRC_EXT_CLK input 011 SPDIF_EXT_CLK, from pads 100 ESAI_HCKT input 101 ipg_clk input (frequency divided) 110 MLB clock input 111 MLB PHY clock input
7 tx_all_clk_en	Spdif transfer clock enable. When data is going to be transfered, this bit should be set to 1.
